EMPYEMA AND PULMONARY ABSCESS.

BY P. C. REMONDINO, M.D.,
OF SAN DIEGO, CAL.

Your interesting editorial on the necessity of a careful diagnosis in these affections, so as not to overlook the possibility of an empyema, are to the point. Too many patients are sent to sanitoriums with an hepatized lung requiring *absolute rest* even to the point of strapping the chest at times, and are simply told that they will not require any medical advice, but on their arrival they are simply to take all exercise possible—advice that they not only take but are sure to overdo—a weakened heart and an impervious lung, with its tissues on the balance as to whether they shall go towards health by proper resolution or go into softening and decay, very soon render a simple case of the most common results of pneumonia that would otherwise recover, into one simulating a case of advanced phthisis, and with the same disastrous results. Eighteen years of practice among a class of pulmonary invalids, with some scores of post-mortems that in many cases developed the fact that quite a large percentage of pulmonary fatal cases were not of tubercular phthisis, or even of simple, chronic consumption, but cases originating in an acute sthenic pneumonia or pleurisy, ending by improper and careless advice about "roughing it" into an inevitable break down of the lung and the patient.

Not alone is the poor patient allowed to die and be buried after an easily avoidable death, but his progeny must go through life feeling that "tubercular phthisis" is in them and of them, to dissuade them from this or that vocation, interfere in prospective marriage ties, and make many reluctant to launch offspring, with such a taint, into the world. Then, again, the life insurance examiner stumbles against the phthisical death of father, brother or uncle, to make him hesitate as to the advisability of taking the risk. The effect of a mistaken diagnosis in such cases is far-reaching—even in years after the poor patient has been resolved into the elements, arising now and then to harass his progeny and to cloud his life with dark forebodings.

During eighteen years I have in my own practice run on to six such cases. One very interesting case being that of a Russian physician who became an inmate of the San Diego County Hospital, as a consumptive. On admission he asked me as a favor to allow him to treat himself as he knew what was best for him, even declining a physical examination which I proposed making. He had been in Chicago hospitals, and also in those of San Francisco before coming here. One Sunday morning on my hospital rounds I entered his room, as he was in the act of drawing off his under-shirt, his back was towards me and the opening door caused a coughing spell, when I at once caught sight of the bulging intercostal spaces on inspiration and the greater extent of the right chest when compared to the left. The aspirator withdrew *seventy-four ounces* of pus. The patient made a tolerable fair recovery (having been ill two years), and was able to resume the practice of his profession, dying some two years afterwards from exposure during a cold winter in the mountains while in the arduous work of his profession. Now, here was an intelligent physician, well skilled in diagnosis, well read, and with great clinical and hospital experience in the hospitals of St. Petersburg and of Moscow—with seventy-four ounces of pus filling his right pleural cavity and he perfectly oblivious of the fact.

Another case had carried seventy-eight ounces of pus in the left pleural cavity for over a year, coming from the malarious plains of Italy in the meanwhile. The attack originating in a pleuro-pneumonia consequent on convalescence from a protracted attack of malarial fever. This patient was laboring under blood poisoning at the time of operation, and died about six weeks afterwards from that cause.

One case, also of great interest, a gentleman from Spokane Falls, Washington, had an attack of pleuro-pneumonia in December, 1889, which nearly took his life. From this he escaped with an hepatization of the lower lobe of the right lung, and extensive adhesions of the pleura to the side and back of the same side. His physicians, Drs. Essig and Manley, then advised a

change of climate, directing Southern California as the proper locality. The patient came here, and on the advice of one of the local physicians he departed for the mountains, to an altitude of some 3,000 feet. He then fell in the care of another physician. While in the mountains he failed very rapidly, and on the advice of his brother, from Spokane Falls, he finally decided to return to San Diego for other advice. On his arrival here his wife called upon me, and asked me as a favor, that if I found her husband past all help to tell her privately, and to advise a removal back to Washington, where he might die among his friends and relatives. On my examination I found a large framed man who had always been well up to the time of his present illness, had weighed 207 pounds, but was now emaciated and broken down; feet and legs œdematous, face puffy, hands also œdematous, very short breath and a constant cough. The left lung exhibited all signs of perfect physiological health, as well as the right, excepting a circumscribed spot of dulness about the size of a dessert plate in the rear and lower portion of right chest. The lower edge of the lung along the side seemed healthy and perfect, along the side and above that the same flat dulness was perceptible; the front was chequered with spots of dulness and resonance. I diagnosed the case as one of pulmonary abscess and decided on an operation, in which I was assisted by Drs. McKay, Davis and Magee, of this city. On our consultation it was hard to demonstrate the presence of pus by any of the usual symptoms or signs, as the pus was enclosed in a close and tight sac, which gave neither metallic tinkling, wave motion, bulging or any other sign. The first aspiration withdrew forty ounces of sweet pus, and a subsequent tapping with a large canula and trocar brought twenty-five ounces more. The cavity was then well irrigated with a solution of salt and water until the water was returned clear. The tube through the canula was then allowed to remain for eight days, the last five of which showed only a little discharge of pinkish fluid; canula, tube and all were removed and the puncture allowed to close. Two hours after the operation the patient was in the greatest comfort. The œdema of the face began to subside and the yellow tinge of the skin had disappeared. The pain in the knees and elbows with which he had been racked night and day, and the distressing cough all left him as if by magic, he rapidly picked up in strength and his temperature, which before the operation never was less than 101½°, fell to 98° in the course of two hours, and never again rose to 99° during the first eighteen days, after which he was allowed to leave his bed.

I am satisfied that the abscess was in its formative stage on his arrival in Southern California, and that the mountain exercise and the practice of chest pounding to which his physician subjected him in pursuance of his form of practice (natural healing) hastened the formation of pus. The case was one of great interest, especially so from the obscurity with which the reading a diagnosis was beset, and the rapid recovery, to say nothing of the almost instant relief that followed the operation.

I agree with you in your remarks on plenotomy. I have operated by the Peyrot method, but have every reason to prefer the aspiration even if persisted in after the method of Bulau. As to irrigation, I would not advise carbolic acid or the iodine washings; after either I have always noticed a tendency to temperature elevation, especially after carbolized water (very weak even, with the acid first well rubbed with glycerine, has never been satisfactory to me). I prefer common salt, an ounce to the quart or even much stronger is well tolerated.

Physicians do wrong to their patients in not advising them to call on a physician on arriving at a health resort. The frequency of the occurrence of cases like the above would indicate the need of an occasional physical exploration, which in many cases would undoubtedly save many from an untimely grave.

CLINICAL OBSERVATIONS ON THE INGESTION OF BORACIC ACID AND ITS EFFECT ON THE SKIN, THE BORACIC ACID ERUPTION SO-CALLED.

Read in the Section of Dermatology and Syphilography, at the Forty-first Annual Meeting of the American Medical Association, held in Nashville, Tenn., May, 1890.

BY WM. T. CORLETT, M.D., L.R.C.P., LOND.,
PROFESSOR OF DERMATOLOGY IN WESTERN RESERVE UNIVERSITY, CONSULTING PHYSICIAN FOR DISEASES OF THE SKIN TO CHARITY AND ST. ALEXIS HOSPITALS, ETC., CLEVELAND, O.

In November, 1889, my attention was called to a rash occurring in diphtheritic patients treated with large doses of boracic acid. Dr. Sihler, in whose practice the cases occurred, informed me that it appeared after adopting the boracic acid treatment; he had never before seen the rash in diphtheria.

During the months of December, January and February following, I had the opportunity to follow five cases in the practice of the same physician. The onset, course and other clinical features of the rash appeared with marked uniformity. It made its appearance on the seventh or eighth day after the commencement of boracic acid. First on the forehead, neck and cheeks almost simultaneously; then it invaded the trunk and extremities in as many successive days. In its course it bore a close resemblance to rubeola.

Nor was its course the only resemblance it bore to this disease; the rash itself in color, form and distribution, presented a striking similitude to a mild case of measles. On the contrary, the rash was not elevated above the surrounding skin, and it was more itchy than rubeola usually is. It subsided gradually in the course of from three to five days.

That the rash might be due to the diphtheritic poison had occurred to me; to eliminate this, as well as to further test the effect of the drug on the skin, December 2, 1889, sixteen subjects were given the same quantity per diem (ʒj) as given by Dr. Sihler in the treatment of diphtheria. These subjects were selected from the different departments of the Polyclinic, and were seen from time to time by myself and colleagues. With two exceptions—sycosis non-parasitica and psoriasis—they were free from any eruption on the skin, and most of them were in a fair state of health.

At the end of a week three escaped from further observation; in four gastric disturbances—nausea, loss of appetite, etc.—were so marked that the drug was discontinued after a few days use. No effect was noticeable in the skin. A fortnight passed, one or two more dropped out, no rash.

Of the eight that continued a month, one presented a few itchy tubercles on the forehead. These tubercles involved the sebaceous glands, they were surrounded with a bright red areola, they remained stationary for a month, at which time the drug was discontinued. Of the sixteen, six continued the drug three months, and one seventeen weeks. This latter thought the treatment benefited some visual disorder, and continued with a tenacity worthy more brilliant results. In this case there appeared at the end of four months half a dozen itchy tubercles with a reddish areola, similar to those in the preceding. They were situated on the forehead, scalp and chest.

Boracic acid eruptions, or more properly, eruptions following the use of the drug, have been reported from time to time. These eruptions have differed widely in clinical appearance as well as in other characteristics.

Stillè says a pustular eruption sometimes follows the long continued use of boracic acid. Gower reports in *The Lancet* of September 24, 1881, two cases that developed a typical psoriatic eruption from its use, covering a period of one or two years. In these cases it was found that by adding a few drops of Fowler's solution the eruption disappeared. Morrow, in his admirable monograph on drug eruptions, cites in addition to the above, an instance in which a 4 per cent. solution used as an injection for several days was followed by an erythematous rash over the whole body. Two other instances are cited by the same author of an erythematous rash over the face, trunk and extremities, after washing out the pleural cavity with a 5 per cent. solution.

Few drugs, if any, have the power of causing the wide range of eruptions herein cited as supposed to be due to boracic acid. Neither does there seem to be any uniformity as to time, or clinical features, in the cases reported. Gowers added arsenic to the boracic acid and the eruption left, which, as we know, might follow any scaly eruption from whatsoever cause.

Of the sixteen subjected to an experimental use of the drug, only two showed signs of a cutaneous disturbance; this is strange when we consider that in all there was marked disturbance of the gastro-intestinal tract, which of itself is capable of producing cutaneous lesions.

The eruptions in these two cases were similar; at the same time they were such as one frequently sees in the subjects of acne when suffering from gastric derangement.

So far then, as these observations go, they teach that if there be an eruption due to the ingestion of boracic acid, its presence is so inconstant; its clinical features are so ill-defined, as to leave grave doubts as to its entity.

THE METRIC SYSTEM AND THE SEVENTH DECENNIAL REVISION OF THE U. S. P.

Read before the Missouri State Pharmaceutical Association 1890.

BY H. M. WHELPLEY, M.D., PH.G.

It is probable that in less than two years the seventh decennial revision of the Pharmacopœia of the United States of America will be in the market and ready for the pharmaceutical and medical professions. The progressive druggists of the country will adopt it their law and guide in the manufacture of pharmaceutical preparations and the identification of all official substances. The doctors who are alive to the interests of the times will look to the pharmacopœia for all information that it contains for physicians.

Among the new features of the revised work will be the adoption of the metric system of weights and measures in the manufacture of preparations. The system of "parts" in the previous revision was more conveniently handled by the metric system than any other, but the new work will have the decimal system itself prescribed.

There seems to be some misunderstanding among the pharmacists of the country as to just what it means to thus adopt the metric system. Some have formed the idea that the doctors will then be obliged to write prescriptions in that system, and I have even talked with those who had conceived the idea that patients must give up the

old-fashioned drops, teaspoonsful, etc., for cubic centimeters. Let such persons learn, once for all, that the pharmacopœia is not a guide in prescription writing or dosing. The adoption of the metric system signifies that druggists are to use it in manufacturing the official preparations made in the drug store. They can buy them, sell them, dispense them, and dose them out in any manner they see fit, for it in no way affects the manufacture. The convention at Washington recognized the system as being the most convenient for druggists to use in this manner, and perhaps it will be many a day before the medical profession becomes sufficiently advanced to adopt it in prescription writing.

Still less excusable is the complaint that some druggists have made when they objected to the new system, as it would cause them to throw away their old scales and balances and buy new ones. Only those ignorant of the first principle of weights and measures could stumble into such a shallow complaint. As far as the weighing goes only the new set of weights must be added. I do not think that any scales or balances are sufficiently stubborn in their innate nature to refuse to respond to metric weights.

Again some one has objected to the metric system and refused to learn a new language for the sake of it. I think they must have studied "French in Twenty Lessons" or "German in Two Weeks" and become scared at the mere mention of a foreign word. It is, indeed, strange that it is necessary to answer such an objection as this, for the terms in the metric system are from the Latin and the Greek. These two languages go far towards making up all words we learn in pharmacy and medicine. Then, when we come to realize that the words "milligram," "gram," "cubic centimeters," "kilo" and "liter" are all that a druggist or doctor need learn, it is strange that any one should for a moment object to the system on the score of the language. In this connection I must quote from a committee of the American Association for the Advancement of Sciences, where it says: "For the use of these professions (medicine and pharmacy) six lines contains all that is necessary," as follows:

1,000 milligrams make 1 gram.
1,000 grams or cubic centimeters make 1 kilo or liter.
1,000 kilos make 1 ton.
65 milligrams make one grain.
15½ grains make 1 gram.
31 grains make 1 ounce troy.

I advise those who object to the metric system to devote a few minutes to its study before they continue to condemn it.

In becoming familiar with the metric system, first study the principle of the system and then learn its relation to other systems.

As nearly all of the text and reference books in pharmacy devote more or less space to the consideration of the metric system, there is no excuse for a druggist saying he cannot find an explanation of the system. May the time soon come when they will all be familiar with it.

MEDICAL PROGRESS.

TREATMENT OF BLEPHAROSPASM.—This annoying and at times intractable affection is treated by Giraud (*Thése de Paris*) by forcible dilatation. Under cocaine anæsthesia the lids are widely separated, by a pair of retractors, or a spring speculum. The separation of the lids is carried to the degree of exposing the conjunctival cul-de-sac, and it is maintained for three or four minutes. Only in rare cases must this procedure be repeated more than three or four times.

PHOTOPHOBIA CURED BY ANÆSTHESIA OF THE GASSERIAN GANGLION.—GUTTIEREZ-PONCE, in the *Recueil d' Ophthal.*, relates the circumstances attending this somewhat novel procedure. The patient, a boy, aged 13, suffering from acute diffuse keratitis, was attacked with violent sneezing as soon as the lids were opened and light fell upon the cornea. This the writer attributed to direct irritation of the branches of the ophthalmic division of the fifth pair of nerves supplying the cornea. To overcome this condition a few drops of chloroform was instilled into the right external auditory meatus, and after a few minutes the eye could be opened and thoroughly examined without exciting sneezing.

POISONING BY FILICIS MARIS.—Up to the present three cases of poisoning by this drug have been reported; two of them proving fatal. A recent case reported by HOFMAN (*Wien. Klin. Wochenschr.*) is that of a little girl 5½ years of age, who was given 7.5 grams of the ethereal extract of filicis maris, for the removal of a tapeworm. At the end of one and one-half hour deep sleep ensued, which was followed at the end of three hours by convulsions and death. The post-mortem examination was negative; it simply showing a preëxisting miliary tuberculosis of the lungs and abdominal organs.

ANOSMIA.—DR. ZWAARDEMAKER, of Utrecht (*Schmidt's Jahrbucher*), presents a clinical analysis of the somewhat rare and by no means important disorders of olfaction. He divides the affection into four general groups: a. respiratoria, a. gustatoria, a. essentialis and a. intra-crania. Under essential anosmia he classes those from acute catarrhal inflammations of the nasal mucosa, toxic forms from poisonous gases or fluids, or those caused by absence of the peculiar pigment found in the region of the olfactory.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION,
No. 68 WABASH AVE.,
CHICAGO, ILLINOIS.

All members of the Association should send their Annual *Dues* to the *Treasurer*, Richard J. Dunglison, M.D., Lock Box 1274, Philadelphia, Pa.

LONDON OFFICE, 57 AND 59 LUDGATE HILL.

SATURDAY, DECEMBER 27, 1890.

CONCLUSION OF VOLUME XV.

With this number THE JOURNAL reaches the conclusion of its fifteenth volume. Seven and a half years have elapsed since the Association assumed the responsibility of publishing its Transactions in the present form. So far as we know, not a single member of the Association now dissents from the method then adopted.

Each year has witnessed a growth of confidence in the enterprise, until its permanency is reasonably assured. We come to the close of the present volume with a constantly enlarging list of contributors, with an increasing membership, and with an advertising patronage never so liberal as at this date. The members of the Association will be gratified to know that not only is THE JOURNAL free from debt, but that it has, of funds, enough in sight to enable it to close the financial year with a satisfactory balance in its treasury. The confidence of a generous advertising public is best indicated by constancy of its patronage.

It will be the aim of the Trustees, to whose supervision it is confided, to make THE JOURNAL more and more fully representative of every medical interest. It welcomes to its columns the proceedings of all medical societies in affiliation with the Association. It is in hearty sympathy with every effort for the advancement of medical education. It seeks the welfare of all legitimate practitioners, and welcomes to its files all medical journals which have at heart the upbuilding of the profession and the welfare of the people.

It seeks from the membership a generous support, and an earnest effort to increase its circulation and to enhance its usefulness.

THE MEDICINE OF THE FUTURE.

Attempts to forecast the future are notoriously involved in much difficulty and uncertainty. The advice of HOSEA BIGLOW: "Don't never prophesy unless you know," will always have more or less pertinency. Nevertheless, so long as curiosity continues to be as potent a motive as at present, the effort will probably continue to be made. He would have been a bold man who should have ventured to predict, fifty years ago, the progress that has been made in medical science and art, and it would certainly be unsafe to attempt to say what will not be accomplished in the next fifty or hundred years; but there are certain tendencies, at the present time, which may, perhaps, throw some light on the probable future course of events. If we compare the best specimens of the medical profession of to-day with their predecessors of a century ago, it may enable us to imagine, to some extent, in what way our successors of a century hence will differ from us.

Of course, the well educated physician of to-day knows a multitude of facts, of importance to him in his practice, of which the greatest men of the past had no conception. This, however, is not, to our mind, the most striking difference between the physicians of the present and of former days. A more important contrast may be found in the relative emphasis laid on the cure and the prevention of disease. Of course there are many survivals of a type characteristic of a bygone age, and it is not unlikely that skepticism in regard to therapeutics may have often been carried too far. Still, it may safely be said that there are very few intelligent physicians of the present day who feel anything like the confidence in their greatly increased resources for combating disease that was felt by the great body of the profession in the bleeding, blistering, purging and puking which made up the great part of the routine of medical practice within the memory of some now living, and, although the progress made in the treatment of disease is by no means to be despised, it can scarcely be questioned that it has consisted almost as much in abstaining

from mischief as in doing good. The records of the Massachusetts General Hospital seem to show that, allowing for differences in the class of patients treated, the death-rate from pneumonia in that institution has not varied very materially since it was opened. Cholera, yellow fever, scarlatina and typhoid fever, do not present any such lowering in the death-rate of those attacked as to be a matter for very much congratulation, and the multitude of remedies recommended for pulmonary consumption shows how unsatisfactory its treatment is. On the other hand, the mortality from cholera, yellow fever and typhoid fever, taking them as examples of diseases in which, until comparatively recent times, there was nothing that could be called an efficient prophylaxis, has been so reduced wherever proper sanitary measures have been carried out as to make it reasonably certain that nothing but the universal enforcement of such measures is needed for their complete extermination.

At first sight, surgery, in its various branches, may seem to be an exception to this rule, but the exception will be found to be more apparent than real. The advances in methods of diagnosis and in operative technique have been, in some departments, very great, but by far the most important difference between the surgery of to-day and that of a comparatively recent period consists in the intelligent application of means to prevent those diseases which formerly so often frustrated the best work of the surgeon. The therapeutics of pyæmia and septicæmia, when the source of infection is not accessible, cannot be said to have made any great advance; it is to the precautions against their occurrence that the greatly diminished mortality from surgical operations is mainly due.

Considered from this point of view, the comparison that is sometimes made between the advancement of surgery and medicine is not so much to the disadvantage of the latter as might, at first, appear. The surgeon, as such, only benefits those who come under his treatment; the sanitarian, even without official authority, may be able to preserve the health of numbers who, but for him, might have sickened and died.

During the last decade the death-rate in England and Wales averaged 1,144 per million less than during the ten years preceding—equivalent to a saving of about 30,000 lives per annum. This is by no means the whole of the saving; a high death-rate implies a large amount of sickness among the survivors, with loss, not only of the time and earnings of the sick, but of those who are occupied in caring for them. There can be no reasonable doubt that the greater part of this immense saving is to be credited to the efforts of the medical profession directed to the improvement of sanitary conditions.

The superiority, even in the present state of our knowledge, of prevention to cure of disease comes out conspicuously in a comparison of the death-rates of Birmingham and Manchester. Both are manufacturing cities, of not far from equal population, and it is not to be supposed that there is any very material difference in the skill of the physicians of the two towns, taken collectively. Birmingham is widely known to be a remarkably well-governed city, in the thoroughness and efficiency of its sanitary administration as well as in most other respects, while Manchester bears a very different reputation. The death-rate of Birmingham is eighteen, and that of Manchester twenty-nine per thousand inhabitants—a difference of nearly 40 per cent.

Sanitary science is yet in its infancy, and the little knowledge we have has been applied, thus far, on a very limited scale. Whatever advance may be made in therapeutics, it seems safe to predict that the relative importance of preventive medicine will continue to increase for a long time to come, and that the physician of the future will be, to a far greater extent than at present, the adviser of his clients, rather than a tinker, called in to repair damages.

The applications of medical science to some of the most important and difficult social problems are just beginning to be dimly perceived. Although the practicability of a physical diagnosis of crime may, perhaps, be thought to be the dream of enthusiasts, it is becoming clear that the majority of habitual criminals and prostitutes consists of persons whose organization was originally defective, and who are only to a limited extent amenable to the motives that govern the conduct of persons of thoroughly sound mind. A recognition of this fact must, in time, work a great change in criminal jurisprudence. Here, again, it will, in time, be recognized that prevention is better than cure, and that cure is to be effected, if at all, not by penalties arbitrarily inflicted in

a spirit of revenge, but by a course of training scientifically adapted to substituting habits of order and industry for the lawless impulses of a defective character.

Inebriety, again, is coming to be recognized as not merely a vice, but at least equally a disease. The man who has saturated his body with alcohol for a series of years has not merely contracted an injurious habit; he has poisoned his nervous system until it is no longer equal to the effort of self-control that might reasonably be demanded of a healthy man.

These examples are enough to show that, in the not distant future, we may expect that the medical profession will afford a field for statesmanship of the highest order. It is not to be expected that the prejudices of ages will pass away at once, but truth will prevail in the end, and sooner or later it will be understood that the man who teaches his fellows how to preserve their own lives is at least as honorable as he who enables them to destroy the lives of others, or to gain possession of their property without compensation

EDITORIAL NOTES.

BLINDNESS IN RUSSIA.—There are said to be no fewer than 189,872 blind persons in European Russia, Poland, and the Caucasus. In Russia the proportion of blind per 10,000 inhabitants is 21; in the Caucasus it is 15 for men and 14 for women; while in Poland it is only 7. There are three regions in Russia where blindness is particularly prevalent—in the extreme north-west to the west of the White Sea, in the east near the Asian frontier, and in the west near the Polish frontier. The condition is said to be on the increase, chiefly owing, it is supposed, to the spread of purulent ophthalmia neonatorum.

THE FIRST INSANE ASYLUM IN CHINA.—A committee has been formed in Canton, under the chairmanship of Dr. J. G. Kerr, to obtain funds for founding an insane asylum for Chinese. At the present time there is no such institution in the whole of China, and at the missionary hospitals considerable embarrassment has from time to time been caused by the application of lunatics for treatment. In many instances these unfortunate persons have been left on the hands of the physicians, who have no suitable accommodation for such cases. Messrs. Deacon and Co., of Canton, will receive subscriptions, and the scheme is strongly advocated by Professor E. P. Thwing, of Brooklyn, New York.

AN ENLIGHTENED DONOR.—M. Alfred Nobel, who is described by the *St. Petersburger Medicinische Wochenschrift* as "the well-known Russian petroleum prince," has given a sum of 50,000 crowns to the Carolina Institute of Stockholm to be applied for the furtherance of experimental research in the sphere of medicine. A committee of Stockholm professors has decided that four-fifths of the interest shall be used every year in aid of scientific investigations on subjects connected with the healing art, the remaining fifth being allowed to accumulate to form a reserve fund.

A NOTE OF WARNING.—From the *British Medical Journal* we quote the following: At the first meeting, for the present session, of the Royal Physical Society of Edinburgh, the opening address was given by Dr. Sims Woodhead, retiring Vice-President. The subject was bacteriological science, and he uttered a word of warning in regard to the too hasty conclusions that were being rushed at in regard to the curability of tuberculosis pulmonum by the new method of Koch. He urged that while Koch himself had been able to support almost every thesis he had hitherto proposed, it was meanwhile necessary to wait till evidence had accumulated sufficiently to afford proof.

Observations on the pulse have shown that after injection the pulse is quickened, at the same time becoming soft, dicrotic and irregular. So compressible is it in some cases, that collapse can only be averted by the free exhibition of stimulants.

Some of von Bergmann's cases are said to have already relapsed. It is also stated that in a case of lupus under the care of Dr. Levy, which was shown as an example of complete cure, the disease recurred with great intensity a fortnight after the discontinuance of the injections.

At a meeting of the Berlin Society of Public Hygiene on November 24, Dr. Köhler summed up as to the discovery by saying that the remedy is unquestionably of considerable importance as an aid to diagnosis, but that, as regards its curative efficacy, the medical profession must suspend its judgment till more definite information, both as to the details of the treatment and its results, is forthcoming.

TOPICS OF THE WEEK.

MICRO-ORGANISMS IN GREAT CITIES.

Professor Tarnier, in his course of lectures on obstetrics, in 1890, referred to M. Miquel's researches on the relative abundance of microörganisms in different places. One to the cubic metre of air is the proportion at the top of a high mountain. In the Parc de Montsouris, in the south of Paris, M. Miquel found 480 microörganisms to the cubic metre of air, whilst in the Rue de Rivoli the proportion was 3,480. In a new room in the Rue Censier he found 4,500 to the cubic metre; more, that is to say, than in the centre of Paris in the open air. In a room in the Rue Monge, he counted 36,000, in the Hôtel Dieu 40,000, and in the Pitié, an older hospital, 319,000 microorganisms to the cubic metre. At the Observatory, Montsouris, 650,000 microbes were found in a gram (15 grs.) of dust; in the room in the Rue Monge the amount was 2,100,000. In the hospitals the proportion was so high that counting the number of microbes in a whole gram of dust was found to be impossible. The dust is the great conveyor of microörganisms. At 2 A.M., when a city is most quiet, the fewest germs are to be found in the air, at 8 A.M. the industry of domestic servants and dustmen has already made the air teem with germs. At 2 P.M. the proportion has again greatly fallen; at 7 P.M. it is once more high, for many houses are being "tidied up;" besides, sundry kitchen operations are unhygienic. Thus the "small hours," unfavorable in many respects to patients hovering between life and death, are the least septic of the twenty-four. The day proportions indicate that household duties cause more septic diffusion than is excited by traffic and industry.—*Brit. Med. Jour.*

THE NEW THEORY OF HEREDITY.

Scientific circles throughout the world have been somewhat agitated of late, by a new theory of heredity broached by the celebrated German biologist, Professor Weismann, of Freiburg. This theory is so subversive of current opinion on matters with which it deals, and assails so many beliefs that were previously deemed impregnable, that a brief review of the leading indications of the theory may not be inopportune.

Professor Weismann's theory seeks to explain what no doctrine of heredity has hitherto adequately accounted for—how a single microscopic cell, imbedded in the ovum of the mother, can reproduce parental characteristics even to minute details and frequently characteristics of grandparents or more remote ancestors. Darwin's doctrine of pangenesis attempted a solution of this problem by assuming that the cells of the body threw off gemmules which were ultimately concentrated in the reproductive cells, the germ cells thus becoming essentially co-substantial with the other cellular elements of the body. The doctrine of pangenesis never, however, held a very sure footing, and its overthrow only seemed to be awaiting the birth of the next biological theorizer.

Two leading principles underlie the basis of Weismann's theory, both of which will strike some as being more in the nature of assumptions than as well-ascertained data for a far-reaching biological induction. The first of these is, that death is not a primary attribute of living matter, and the second is, that characters *acquired* by the parent are not transmitted to the offspring.

The protozoa, the unicellular organisms are, however, alone endowed with this immortality. Composed of undifferentiated protoplasm, apparently structureless, and with no unlikeness in parts save for the nucleus, these organisms yet essentially perform all organic functions. They may be dried up by frost or drought, but under appropriate conditions they resume their active life. The protozoon may of course be destroyed by fire or accidental agencies, or it may be eaten. It enjoys a potential, although of course not an absolute immortality; under the normal conditions of its environment death does not overtake it. Unfortunately, for the higher inferences the theory would otherwise encourage, the endowment of immortality does not pertain to the metazoa, the many-celled organisms; for, as soon as an organism is sufficiently ambitious to become many-celled it has practically sealed its fate, it has "put on mortality," a conclusion which will doubtless be exceedingly gratifying to the metaphysical pessimists. The metazoa arise from the protozoa by "unequal fission," through the failure of certain unicellular organisms to "divide completely." "The first multicellular organism," says the Professor, "was probably a cluster of similar cells, but these units soon lost their original homogenity. As the result of mere relative position there arose division of labor, some of the cells were especially fitted to provide for the nutrition of the colony, while others undertook the work of reproduction." The outer cells of the cluster in constant contact with the nutritive medium would be differentiated for nutrition, while the inner cells would undertake the work of reproduction. In these latter cells the reproductive function would be so specialized that they would become the germ-cells, in the nucleus of which resides the germ-plasm. The possession of this would constitute these cells the immortal part of the metazoa. Thus the fundamental key to an interpretation of the facts of heredity lies, according to Weismann, in the "continuity of the germ-plasm." This germ-plasm is so stable that "it absorbs nourishment and grows enormously without the least change in its complex molecular structure," and heredity is secured by the transference from one generation to another of this exceedingly stable substance with a definite molecular and chemical constitution.

All this being so, acquired variations have no direct reaction on the unalterable germ-plasm, and are, therefore, not transmitted. The organism that has acquired one-eyedness, or one-legedness, or circumcisedness does not transmit these characteristics, because both parent minus the parents' individually acquired characteristics. and offspring arise out of the same substance, and the offspring must of necessity resemble the parents,

But it will be asked how then do variations in organisms occur? Solely through natural selection, for each new organism combines the hereditary tendencies de-

rived from the male and female germ-plasms. This results in individual differences, which multiply in geometrical ratio, so that "in the tenth generation a single germ contains one thousand and twenty-four different germ-plasms with their inherent hereditary tendencies, and as continued sexual reproduction can never lead to the reappearance of exactly the same combinations, new ones must always arise."

Professor Weismann does not entirely deny the influence of external forces upon the germ-cells. In his essay on "The Continuity of the Germ-Plasm," we read: "I am compelled to admit that organisms may exert a modifying influence on their germ-cells." What he does deny is, that functionally-acquired variations or "somatogenic" variations are not transmissible, only the "blastogenic" variations—the variations occurring in the germ-cells. In this way we understand why club-foot is hereditary, while one-eyedness is not.

Possibly the weakness of Weismann's theory lies in the unsatisfactory way in which it accounts for psychical evolution. How serious are the issues involved in the new theory is exemplified in the following quotation from Herbert Spencer's "Factors of Organic Evolution," which fairly represents the hitherto accepted theory of psychical evolution.

"If functionally-produced modifications are inheritable, then the mental associations habitually produced in individuals by experiences of the relations between actions and consequences, pleasureable or painful, may in the successions of individuals generate innate tendencies to like or dislike such actions. But if not, the genesis of such tendencies is, as we shall see, not satisfactorily explicable."

We refrain from indicating the interesting relations that could be established between this theory and the problem of disease-transmission, or from showing how syphilis and hare-lip originate in "blastogenic" modifications. We also refrain from indicating the exceptions that might be taken to Weismann's argument all along the line, or the objections that could be urged to almost every proposition. We are content if we have shown the great value Professor Weismann's views have been, in stimulating inquiry regarding the soundness of the foundations of any and all theories of heredity.—Editorial, *Physician and Surgeon.*

THE DEADLY CIGARETTE.

Death from cigarette smoking appears to be not uncommon amongst boys in America, according to the *Medical Record* of New York. It appears that two cases occurred during the last week in October; a boy aged 14 died, it was reported, of heart disease "superinduced (*sic*) by excessive use of cigarettes." A boy aged 16 hanged himself because his father refused to give him money to buy more tobacco. A year ago Dr. Broomhead reported a case where a boy aged 13 died presumably from the effects of cigarette smoking. Valvular disease of the heart was discovered after death. Our contemporary wisely adds that since it is not admitted that tobacco can cause organic heart disease, it must be inferred that cigarette moking is fatal in boys who have cardiac or other disease already. Kjelberg has described a nicotine psychosis, in which depression and suicidal tendences are often observed. It is more frequent in snuff-takers and tobacco-chewers than in smokers. We must not overlook the fact that many of the young gentlemen who smoke in America have other unhealthy habits, and their mode of living is often demoralizing. The same applies to many British boy smokers. Well-trained lads suffer less, and being well-trained are prevented from smoking to excess, if at all.—*Brit. Med. Journal.*

THE REDUCTION OF THE GENERAL DEATH-RATE.

There is a belief that the death-rate is reduced by modern civilization. It is interesting to be able to secure positive observations supporting this belief. It is well known that in England and Wales such observations have been made extending over a term of years. Earr's first life tables were based upon the mortality in 1838 to 1854 in England and Wales. Comparing this with the last life table, and we find that by the old table the mean life-time of males was thirty-nine and ninety-one one-hundredths years, while by the new table it is forty-one and thirty-five one-hundredths years, a gain of about a year and a half upon the length of life of each male. Hence a million males would live one million four hundred and thirty-nine thousand, *plus*, more years than during the period of the old table. The expectation of life at birth of females has been augmented by two and seventy-seven one-hundredths years. Two millions of population will thus live more than four millions more years than they would during the period covered by the old table; or sixty millions of people would live one hundred and twenty millions more years than they would have done at the beginning of the present century. Further, the gain in these lives is mainly between the ages of 25 and 65, the most valuable portion of life. According to Earr, the minimum value of each life is about eight hundred dollars. It is easy to see that the momentary gain from this reduction of death-rate has been enormous.—*American Lancet.*

CABLEGRAM RECEIVED DECEMBER 15, 1890.

A long cablegram received from Dr. Guiteras may be summarized as follows:

"A greater degree of caution is being observed, especially as to the selection of cases of pulmonary phthisis subjected to the lymph treatment. The results in this disease at least, are as yet inconclusive. Many cases are not decidedly improved. There is some risk of complication. Both pneumonia and meningitis have been observed. The general situation may be summed up by stating that a spirit of caution prevails in Berlin to-day."

DOMESTIC CORRESPONDENCE.

Hypnotism.

To the Editor:—I think you have done the profession a good service in bringing before it the excellent paper by Dr. Lackersteen on "Hypnotism," with the comments upon it by the able gentlemen who spoke at its conclusion. I regard as in the right line the suggestion of Dr. Lackersteen that a judicious committee be created to examine into the uses of the hypnotic state, together with its abuses also, and give public, authoritative protests against popular exhibitions of it by wandering mountebanks. As a popular affair the whole thing, in my judgment, should be stamped out as dangerous and destructive.

I had occasion, some years ago, to attend some of the exhibitions given by Carpenter in Tremont Temple. He had found in his travels several facile subjects, which he took from place to place, and with whom he did his most marvelous feats. His chief dupe was a tall, sandy-complexioned man, who was arranged to take his seat in the back part of the audience, and on a look from Carpenter would instantly lose self-control, and go over the backs of the seats before him and clamber upon the platform. Of course this made a sensation to start with.

Now it happened that this man was married, and his wife gave birth to a pair of twins in my presence as consulting physician. She, like him, was very nervous, and though there was nothing unusual in the confinement, had to crown all by a subsequent eclampsia, which was relieved by a little chloral and chloroform. One of the children, the smaller, appeared fairly well, while the other was fretful and cried most of the time, and died after a few weeks. When the wife was being confined the husband acted like a crazy man. He came into the room, but soon left and went down stairs, where I found him lying on his back on the lounge, writhing, kicking and pulling his hair, and moaning at a great rate. His face was red and his eyes suffused with tears. Now all this was without reason, unless we assume that the sight of his laboring wife hypnotized him into labor himself. Surely, in this case, the mountain labored without the appearance of a mouse even. I assured him that his wife was all right and he the father of a pair of boys, and got him out of his "symptoms." After this I had quite a long talk with him, only to be impressed with the sad destruction of mind which the habit of hypnotism is capable of producing, assuming that this man had any mind to start with. Frequently do visions of this almost demented creature rise to my mind, impressing me more and more with the delusions and damage of the dangerous habit, for either it reduces wise men to fools or makes fools the puppets for the sport of the more intelligent. In either case, due professional dignity should frown on public exhibitions of strong wills making sport over human weakness. Respectfully,

E. CHENERY, M.D.

Boston, November 24, 1890.

Dr. Josephus Craft, of Cleveland, O., Claims to have Discovered the Identical Lymph of Dr. Koch.

To the Editor:—Through some experimental research that I was led to make about two years ago, in reference to a bacillicide, certain peculiar results were attained which surprised me.

Not being a man of wealth or leisure, nor having a Government appropriation to keep the wolf from the door, I was obliged to drop it for the time—thinking that perhaps I might take it up some time in the future and push it to a satisfactory completion if possible, with my limited means for doing such work.

Hearing of Dr. Koch's announcement of the discovery of a substance that would cure consumption, lupus, and other allied maladies, I bethought me that perhaps it would be well to follow up the experiments already begun.

When I read of the effects of his discovery, it impressed me forcibly that it was in the same field in which I had been looking. I thought that perhaps I might discover what would produce the same happy result. I immediately began on the same base I had left, "cutting and trying," all the time working with the same preconceived objective point in view. I have reached that point. Those results I have succeeded in establishing. Now I am not unmindful of the gravity of the astounding announcement I am about to make, especially if it be not true, when I say that I have discovered the identical lymph of Dr. Koch.

I have put the lymph to the crucial test upon rabbits and guinea pigs, and finally upon myself, with effects identical with those described by Dr. Koch. I find it to be a tremendously potent agent; so that .01 of a cubic centimetre, or even less, of what I denominate a 2 per cent. dilution, produces its characteristic effect.

I shall have to rely upon what I have gotten in a physiological state as yet, for I have not applied it to consumption, etc. Dr. Koch, in describing the effects of his lymph upon himself, says:

> I injected .025 of a cubic centimetre in the upper arm. Three or four hours after the injection had been made, there was experienced a contraction of the limb, and at the same time there was a desire to cough, with dyspnœa. These symptoms increased rapidly, and four or five hours thereafter I experienced an unusually violent rigor, the shivering lasting nearly an hour, and was accompanied by nausea and vomiting. Temperature rose to 105.2°. After twelve hours the symptoms began to abate, and the temperature fell, and the following day became normal.
>
> The heaviness of the limb and the lassitude continued for some days, during which time the arm into which the injection had been made continued painful and red.

The following is the effect of my lymph upon myself. I injected .50 of a cubic centimetre in the outside of my thigh at 9:45 P.M., retiring immediately. At 2 A.M. I woke with considerable dyspnœa and a desire to cough frequently. Took my temperature and found it 97°, pulse 84. I again retired, but could not sleep from nervous excitement, perhaps partly due to finding the effect of Dr. Koch's remedy "on time" in my own case. (Some of Dr. Koch's cases which have been treated since he was, experience a lowering of temperature below normal the first few hours.) After rising in the morning I found my temperature normal, pulse 86, dyspnœa and cough still remaining. At 9 A.M. I felt well enough to start out and see my patients.

Soon after starting I began feeling rigors with considerable general malaise. I continued my work until 1:30 P.M., when I was having decided chills, temperature 105.5°, pulse 104, some dyspnœa still remaining, with twinges of wandering pains, and waves of nausea coming and going, but no vomiting. At 5 P.M. temperature 102°, pulse 104, dyspnœa not all gone, occasional nausea, slight wandering pains throughout the body, point of injection getting red and somewhat painful. Retired early but felt nervous, with general weakness. Next morning no nausea, fair appetite, dyspnœa gone.

I am a healthy man, but have had in one of my nostrils for years a small epithelial sore, crusting over and exfoliating in a few days, to repeat the crust and again come off. This little sore became inflamed and tender, but has now dried up and no crust reforming. Now, this is my case from the effects of my lymph. The foregoing was Dr. Koch's case from the effect of his lymph.

My lymph is of a syrupy consistence, and in its more concentrated form slightly brownish in color, but in the diluted form for use is slightly smoky-looking, but transparent. Dr. Koch is using a much stronger solution than I, for he used only .025 of a cubic centimetre, while my largest injection was .50 of a cubic centimetre; the effects upon each of us, as can readily be seen, were very analogous.

In order to have the verdict of the medical fraternity upon this lymph, which I am sure is Dr. Koch's, I will immediately send samples for testing to prominent physicians in New York, Philadelphia, Cincinnati, Chicago, St. Louis and St. Paul.

By following Koch's directions, with the dosage of my lymph, you will realize just what you would with his lymph in his dosage.

Work will immediately be commenced here in the different hospitals, in conjunction with the physicians of this city. As soon as possible arrangements will be made for treating the sick generally. Respectfully,

JOSEPHUS CRAFT, M.D.

64 Streator Ave., Cleveland, O.

BOOK REVIEWS.

AMERICAN BULLETIN VISITING LIST.—This little volume is in some respects quite original, and we invite inspection, believing that many physicians will incline to the use of a book thus arranged. Its tables are ample and the new remedies are fully represented. F. A. Davis & Co., Publishers. 1231 Filbert Street, Philadelphia.

THE PHYSICIAN'S ALL REQUISITE TIME AND LABOR-SAVING ACCOUNT BOOK.—F. A. Davis & Co., Philadelphia. This is a combination of an account book and ledger—is at once condensed in arrangement and simple in its method of presenting the items of each and every account at a single glance. We commend the work in every thing except its name.

MISCELLANY.

SCIENTIFIC STUDY OF INEBRIETY.—The American Association for the Study and Cure of Inebriety will hold a series of monthly meetings, in the hall of the New York Academy of Medicine, for the medical study of Alcohol and Opium Inebriety. Special phases of this subject will be discussed each evening in papers by leading authorities, followed by remarks and reports. The first meeting was held on December 10, "The Relation of Life Insurance to Alcohol and Opium Inebriety," was presented. January 7, 1891, "Alcohol: its Physiological and Pathological Action, and its Use and Abuse in Medicine," will be discussed. "Inebriety, its Etiology and History," will be the topic for February 18. "The Curability of Inebriety, its Treatment and Relation to other Diseases," will be the subject for March 18. In April, "The Medico-legal Relations of Inebriety," will be studied. It is the purpose of this Association to confine these discussions entirely to the medical and scientific side, with the view of reaching some general conclusions from which more accurate researches can be made.

A cordial invitation is extended to all medical and scientific students to be present and join in this special study of the "Drink Disease and its Problems." Dr. T. D. Crothers, of Hartford, Conn., is the Secretary.

PROF. NICHOLAS SENN has resigned the professorship of surgery and surgical pathology of Rush Medical College, Chicago. The resignation was accepted at a meeting of the faculty previous to the college memorial exercises at Central Music Hall.

LETTERS RECEIVED.
